

# Network Deployment

VersaLex Trader

## Network rollouts made easier, faster

To ease and speed the implementation process with your communication partners, VLTrader has the ability to automate the configuration of LexiCom to your trading partners. VLTrader creates a customized, simple client package for communication partners and automates the deployment of the client connections. The communication partner simply runs an easy, automated install and they can begin exchanging information with your server.

Take control of and speed up network rollouts by removing all configuration and setup obstacles for trading partners. To facilitate VLTrader network rollouts, VLTrader administrators can provide deployment URLs to LexiCom users. The deployment URL points to a zip file located in VLTrader that contains the configuration data for one or multiple trading partners. The configuration data includes a host file that points back to VLTrader as well as any configurable LexiCom properties such as a listening ports, user certificates, CA certificates, schedules, etc. - anything that pertains to the trading relationship between VLTrader and trading partners using LexiCom.

The VLTrader Administrator can completely determine the specifics of the configuration package in order to accommodate the network deployment. Multiple specifications can be defined including all properties in the host itself, schedules, certificates, actions, listener, etc. The install can also be soft-branded for a familiar user experience. The administrator can also create and provide special pre- or post-installation instructions and custom documentation for trading partners.

Network Deployment is included with any VLTrader purchase.

**Construct a Cleo LexiCom configuration for one or more trading partners.**

### Features:

- Automate deployment
- Automate client configuration
- Optionally soft brand client (splash screen)
- Select from multiple protocols
- Create special instructions
- Include custom documentation
